USE CASE #1 HR Tech

"Smart Talent Selection Engine"

Problem Statement

Traditional Applicant Tracking Systems rely on primitive keyword matching, causing recruiters to accidentally reject highly qualified candidates who use different but equivalent terminology. With 1,000+ applicants per role, recruiters spend an average of just 6 seconds per resume — leading to missed talent and wasted effort reviewing unqualified candidates who have learned to "game" the system.

Pain Points

- Keyword-based filtering rejects qualified candidates who use synonymous terminology
- Manual review fatigue leads to poor hiring decisions at scale
- Candidates who "keyword stuff" rank higher than genuinely skilled ones

Objective

Build a system that understands the **meaning and intent** behind a resume — not just keywords — to intelligently rank candidates against a Job Description.

Features to Build

Feature 1 — Multi-Format Resume Ingestion Portal

A secure bulk-upload portal that can parse resumes of any layout or format.

→ Accept PDF, DOCX, and image formats (JPG/PNG)

→ Handle non-linear layouts such as two-column resumes, sidebars, and tables without merging unrelated text

→ Show upload progress and flag corrupt or unsupported files

→ Organize uploaded resumes by Job Role or Batch Date

Feature 2 — JD-to-Candidate Ranking Dashboard

Allow recruiters to upload a Job Description and get a logically ranked, AI-justified shortlist.

→ Calculate a Compatibility Score (0–100%) based on semantic alignment with the JD — going beyond keyword matching to understand intent

→ Prioritize depth of experience over mere mentions of a skill

→ Generate a 2-sentence "Summary of Fit" for the top 5 candidates explaining why they ranked highly

Submission Guidelines

01	**Working Prototype** Submit a functional demo of your application. It should run end-to-end and demonstrate the core AI capability you built.
02	**GitHub Repository** Include a link to your code repository with a clear README explaining how to set up and run the application.
03	**Approach Document** Attach a brief document (max 2 pages) explaining your solution design, tech stack choices, and what you would improve with more time.
